

What is claimed is:

1. An electrical connector assembly, comprising:
 - a mother board;
 - a card edge connector mounted on the mother board and comprising a housing defining a slot, and a plurality of contacts disposed on at least one side of the slot of the housing and exposed into the slot;
 - a daughter card comprising a mating edge inserted into the slot of the housing, a plurality of conductive pads on the mating edge for electrically connecting with the contacts of the card edge connector; and
 - a board hold down, which is separated from the card edge connector and mounted on the mother board, holding the daughter card in the card edge connector and keeping the daughter card parallel to the mother board.
2. The electrical connector assembly as claimed in claim 1, wherein the board hold down comprises a body portion supporting the daughter card to keep a predetermined distance between the daughter card and the mother board.
3. The electrical connector assembly as claimed in claim 2, wherein the board hold down comprises a locating portion extending upwardly from the body portion, and wherein the daughter card defines an engaging hole engaged with the locating portion of the board hold down.
4. The electrical connector assembly as claimed in claim 3, wherein the locating portion comprises a lead-in formed on a top end thereof for guiding the insertion of the locating portion into the engaging hole of the mother board.
5. The electrical connector assembly as claimed in claim 2, wherein the board hold down comprises a leg portion extending downwardly from the body portion, and wherein the mother board defines a retention hole receiving the leg portion of the board hold down.
6. The electrical connector assembly as claimed in claim 2, wherein the board

hold down comprises a resilient arm and an anti-overstress extending from a first and a second ends of the body portion, respectively.

7. The electrical connector assembly as claimed in claim 6, wherein the anti-overstress portion comprises a main section, and a tab perpendicularly extending from the main section and having an upwardly bent distal end.

8. The electrical connector assembly as claimed in claim 7, wherein the board hold down comprises a latch portion extending from the resilient arm and locking a rear edge of the daughter card.

9. The electrical connector assembly as claimed in claim 8, wherein the resilient arm is over the tab of the anti-overstress portion and is deflectable with the latch portion between the main section and the distal end of the tab.

10. An electrical connector assembly, comprising:

a card edge connector comprising a housing defining a slot having an opening at one side of the card edge connector, and a plurality of contacts disposed on at least one side of the slot of the housing and exposed into the slot; and

a board hold down separated from and located beside the one side of card edge connector, the board hold down and the slot of the housing together defining a support plane adapted for supporting a daughter card.

11. The electrical connector assembly as claimed in claim 10, wherein the board hold down comprises an arc-shaped body portion, a locating portion extending upwardly from the body portion, a pair of leg portions extending downwardly from the body portion, a resilient arm extending from a first end of the body portion, and a latch portion extending upwardly from the resilient arm.

12. The electrical connector assembly as claimed in claim 11, wherein the board hold down comprises an anti-overstress extending from a second end of the body portion, and including a main section and a tab perpendicularly extending from the main section with an upwardly bent distal end, and wherein the resilient

arm is over the tab and is deflectable with the latch portion between the main section and the distal end of the tab.

13. An electrical connector assembly comprising:
 - a first circuit board;
 - a card edge connector mounted to the first circuit board and defining a slot with a plurality of contacts beside said slot;
 - a second circuit board having a front edge section angularly inserted into the slot and downwardly rotated toward the first circuit board until reaching a parallel relation with the first circuit board; and
 - at least one deflectable board holder mounted to the first circuit board; wherein
said board holder is located around a rear edge section of the second circuit board, and downwardly presses said rear edge section.
14. The assembly as claimed in claim 13, wherein said board holder includes a locating portion extending into a through hole of the second circuit board, and a latching portion downwardly pressing the rear edge section of the second circuit board.
15. The assembly as claimed in claim 14, wherein said board holder includes a resilient arm connected to the latching portion and restrainedly moveable between opposite first and second positions defined by an anti-overstress portion of the board holder.
16. The assembly as claimed in claim 15, wherein said resilient arm extends between the latching portion and the locating portion in a J-like configuration.
